

Tips for Maintenance of Continental Tyres!

Continental

Tyre maintenance is an issue that makes most car owners cringe. Admittedly, it's not the most exciting thing about owning a car.

However, like in every other aspect of life, sometimes, you just cannot avoid getting your hands dirty. The small hassle that you'll have to endure for taking proper care of your Continental tyres will indeed pay-off in the long run.

Neglecting your tyres for continuity, on the other hand, can cost you dearly; not only in fuel economy and driving pleasure but safety as well.

It doesn't mean that you have to spend an obscene amount of time on your tyres every day. But you should do routine checks at regular intervals to ensure that your tyres are in good condition.

It's especially important during and after the winter season as winters can be harsh for Continental tyres Wolverhampton.

Here's what you can do:

1. Check Tyre Inflation

You have to take extra care in maintaining your car's tyre pressure during the winters. As the temperature drops, so does the tyre pressure. According to industry experts, tyre pressure drops by 1 unit for every 10 degrees decrease in the temperature.

The perils of under or over-inflated tyres are manifold. You may be tempted to reduce your tyre's pressure in cold weather so that it grips the road better. But it results in quicker wear of tyre treads as the tyres produce more heat when under-inflated. In other words, your tyres will age faster if they do not have the recommended pressure.

Over-inflated tyres in Wolverhampton are no better. They result in uneven weight distribution causing uneven wearing of the treads. The treads at the middle of the tyre will wear more than the ones on the sides.

Checking the tyre pressure at regular intervals, ideally before you take your car out for the day ensures that they are properly inflated and will deliver optimum performance. You can use a tyre pressure gauge to check the pressure and match it with the recommended pressure from your car's user manual.

2. Check Tyre Tread Depth

This one's fairly easy to do and takes no more than 10 seconds of your time. The British authorities prescribe a tread depth of minimum 1.6 mm. You can check whether your Continental tyres are compliant with it by doing the simple 20p test.

To do this, you have to put a coin of 20p into the central groove of any tyre. In case the coin's outer band is not visible after insertion, your tyres are doing okay. But if you can see the outer edge, it's probably better to get new Auto Surefit [tyres Wolverhampton](#).

Taking care of your Continental tyres is a small effort to make if you consider its overall impact on your safety and drivability. You can prevent most issues that affect those who do not maintain their tyres in Wolverhampton.
